

Git LFS Setup Guide for Team Members

Purpose

This guide explains how to install Git LFS and access the 141 MB executable stored in the repository.

1. Install Git LFS

Download and install Git LFS from <https://git-lfs.com> or install using Winget: `winget install GitHub.GitLFS`

2. Initialize Git LFS

```
git lfs install
```

3. Clone the Repository

```
git clone <repository-url>
```

If you already have the repository:

```
git pull
```

If the large file does not download automatically:

```
git lfs pull
```

Verify Git LFS Files

```
git lfs ls-files
```

If the executable appears in the list, the setup is complete.

Troubleshooting

Ensure Git LFS is installed and run 'git lfs install'. Then execute 'git lfs pull' inside the repository.
